1. Claims 1-5 are allowed.
2. The following is an examiner's statement of reasons for allowance: a circuit configuration for the bit-parallel outputting the bits of a data word including at least two signal lines for feeding the data signals representing the bits of the data word to driver stages and to a reference circuit and further driver stages are connected in and have inputs connected to establish the signal states of the data signals to be transferred on each signal line and generates a control signal depending on the type and number of the signal state changes parallel with the driver stages has not been shown in the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Ellis, et al. disclose conversion between serial bus cycles and parallel port commands using a state machine. A serial bus processor processes a serial bus transaction represented by the serial bus cycles and is responsive to the parallel port commands. A state machine circuit is coupled to the serial bus processor to provide a plurality of states corresponding to the serial bus transaction. Desai disclose a receive deserializer for regenerating parallel data serially transmitted over multiple channels. A receive deserializer which regenerates parallel data words that have been broken into smaller data words and serially transmitted over multiple data channels

uses an external state machine to shift word clocks with respect to data until the output of the channel last to receive a predefined data reference pattern is framed and provides storage to hold data for the channels which receive the reference pattern earlier.
